VARDENBURG, A.K. 110-12-1/19

AUTHOR: Vardenburg, A.K., Candidate of Technical Sciences.

TITLE: Methacrylate Electrical Insulating Compounds MBK  
(Metakrilovyye elektroizolyatsionnyye kompaundy MBK)

PERIODICAL: Vestnik Elektromyshlennosti, 1957, Vol.28, no.12,  
pp. 1 - 5 (USSR).

ABSTRACT: Methacrylate resins are well-established industrial materials. Those consisting of linear polymers are typical thermoplastics but can be modified by the introduction of cross-linkages between linear molecules. This can be accomplished by co-polymerisation of methyl- and allyl-methacrylates, butyl methacrylates with dimethacrylic ester of ethylene glycol and tri-ethylene glycol. MBK compounds are cross-linked copolymers of methacrylate esters. The polymers can be stored over a year if they are shielded from light and the temperature is not above 25 °C. After polymerisation, the hardest compound is MBK-1; the softest is MBK-3, which is rubber-like, and compound MBK-2 is intermediate between the others. All are chemically inert and water-resistant. They can be used for the insulation of submerged motors, as illustrated in Fig.1. The water absorption and hygroscopic characteristics of polymers MBK are shown in Figs. 2 and 3. Exposure to Card1/3 boiling water for more than 260 hours causes no external change

Methacrylate Electrical Insulating Compounds MBK.

110-12-1/19

to specimens; their elasticity is maintained and the loss in weight is less than 1%. The MBK compounds soften somewhat on heating but do not melt and even at 200 °C maintain their shape. Compound MBK-2 has the best heat-resistance; specimens were heated to 150 °C for 750 hours and every 12 hours the hot specimens were dropped into cold water. After this test the specimens remained elastic and could be bent through 180° without forming surface cracks. MBK compounds are polymerised in 10-18 hours by heating at 70 - 75 °C or, if suitable accelerators are used, in 6 - 12 hours at room temperature. The compounds tend to adhere firmly to the walls of moulds which should, therefore, be specially lubricated. Windings can be insulated with MBK compounds by dipping, as an alternative to the moulding process. The main properties of the polymers are given in Tables 1 and 2. One table gives the main electrical and mechanical properties. The other gives the mechanical properties before and after ageing for 1 000 hours at 125 °C. Both properties were somewhat improved by the ageing treatment. Figs 2 - 6 plot the electrical properties of the materials as functions of temperature. The insulating properties of the compound depend on the polymerisation conditions as shown graphically in Fig.7. The

Card2/3

Methacrylate Electrical Insulating Compounds MBK

110-12-1/19

electrical properties are improved by increasing the polymerisation temperature and prolonging the time of its application. Mineral filler may be used to improve the thermal conductivity; for example, the introduction of powdered quartz in the ratio of 1:1.5 increases the thermal conductivity of cast insulation by a factor of 4 or 5.

There are 7 figures, 2 tables and 3 Slavic references.

AUTHOR: Vardenburg. A.K.  
TITLE: New thermo-setting impregnating compounds  
PERIODICAL: Referativnyy zhurnal, Elektrotekhnika i energetika, no.6, 1962, 4-5, abstract 6 B22. (In Symposium 'Izolyatsiya elektr. mashin, 6. M., 1961, 157-164) (Insulation of Electrical Machines).  
TEXT: The new polyester<sup>15</sup> impregnants type КП (KP) are solventless and, moreover, polymerise rapidly at high temperatures (30 minutes at 125 °C, or 5-10 minutes at 150 °C). With efficient methods of heating (induction heating or short circuit currents) the drying time of impregnated windings was reduced to a few hours or even minutes, which is of considerable importance in the application of high speed automatic conveyor lines to electrical equipment manufacture. Being free from organic solvents the grade KP compounds do not damage the enamel<sup>15</sup> on previously bent wires grades ПЭЛ (PEL), ПЭТВ (PETV), ПЭТВЛ (PETVL) and ПЭВ -2 (PEV-2). The characteristics of the  
Card 1/3

New thermo-setting impregnating ... S/196/62/000/006/002/018  
E194/E154

compounds are given in the table. Grades KΠ -10 (KP-10), KΠ -18 (KP-18) and KΠ -23 (KP-23) form hard strong polymers which do not melt or dissolve. A more viscous (viscosity on viscometer B3 -4 (VZ-4) up to about 7 minutes at 20 °C) compound gives an elastic polymer. Compounds KP-10, KP-18 and KP-22 to which accelerator has been added can be stored at room temperature for more than a month without appreciable increase in viscosity, and compound KP-23 for about two weeks. All the KP compounds are prepared on site by simple mixing of the industrially available materials. Test results are given for viscosity and rate of polymerization and also the characteristics of various compounds as a function of the length of time of their immersion in water, filler content, drying conditions, thermal ageing, etc. In the majority of cases compounds type KP of various grades have better and more stable electrical characteristics than lacquer grade 447, particularly when humid ( $\rho = 15^{10-10^{13}}$  ohm.cm;  $\epsilon = 3.2-6.1$ ;  $\tan \delta = 0.02-0.08$ ;  $E_{breakdown} = 24-40$  kV/mm). Industrial experience confirmed the advantages of using compounds grades KP, which particularly shortened the impregnation and

causes of rejects. Two chapters deal with molds and compression molding for the preparation of high-quality insulating products. Special attention is given to plastics used in electrical engineering. This edition includes up-to-date information on modern plastics and resins. Information on obsolete and less important plastics was excluded. Discussion of laminates was also excluded because they are treated separately in other publications. The author thanks S.V. Shishkin for reviewing the manuscript. There are 274 Soviet and non-Soviet references.

TITLE: Elastic epoxy compounds

SOURCE: Elektrotehnika, no. 4, 1966, 53-55

TOPIC TAGS: epoxy plastic, *synthetic material*

ABSTRACT: A version of the epoxy compound is considered in which type AG-2 and SG-2 linear-structure polyester oligomers are used as curing and modifying agents. A greater distance between two carboxyl groups and a relative mobility of intermediate links in the molecules of these agents are responsible for the high elasticity of the ultimate polymers. These characteristics of ED-6 epoxy resin with AG-2 curing agent (no extender) are reported:

TITLE:

Angular distribution of the penetrating component of exten-  
sive atmospheric showers at a depth of 200 m water  
equivalent

PERIODICAL:

Akademiya nauk SSSR. Izvestiya. Seriya fizicheskaya, v. 26,  
no. 5, 1962, 682-684

TEXT: The angular distribution of the axes of extensive atmospheric  
showers was determined by various methods, mainly using a cloud chamber.  
The direction of the axis was established from the electron-photon  
component. At a distance of  $0.5H$  or less from the shower axis ( $H$  = depth  
at which the detector is placed under the surface), the particle

distribution is given by  $I_{\theta} = I_0 \cos^{8.3\theta}$ , as has been established by various  
authors. The present authors' results agree with this law. There are  
2 figures.

TITLE: Investigation of  $K_2^0$ -meson decays

19.44.55

149  
25  
P

SOURCE: Yadernaya fizika, v. 2, no. 3, 1965, 471-484

TOPIC TAGS: K meson, meson interaction, lepton, radioactive decay, selection rule, pion

ABSTRACT: The authors presented at the 12th International Conference on High Energy Physics, Dubna, 1964, preliminary results of analyses of 683  $K_2^0$ -mesons detected in a Wilson chamber. In the present article, the authors present a more complete analysis using a larger statistical material (1082  $K_2^0$ -mesons). The following probabilities were obtained for leptonic decays of the  $K_2^0$ -meson and for the decay  $K_2^0 \rightarrow \pi^+ + \pi^- + \pi^0$  (with respect to all  $K_2^0$ -decays into charged particles):  $\Gamma_2^+ (+ - 0) / \Gamma_2^+$

Card 1/2

L 13551-66

ACC NR: AP6001154

(charged) =  $0.194 \pm 0.024$  and  $\sqrt{2}(K_{e3}) + \sqrt{2}(K_{\mu 3}) / \sqrt{2} \text{ (charged)} = 0.806 \pm 0.090$ . The data on leptonic decays exclude the S-type interaction and are in good agreement with the V-type interaction and the predictions based on the  $|\Delta I| = 1/2$  selection rule. The energy spectrum of  $\pi^0$ -mesons in the  $K^0 \rightarrow \pi^- + \pi^+ + \pi^0$  decay differs significantly from the phase curve  $\phi(T_0)$ . The value  $\alpha = -8.2^{+1.3}_{-0.9}$  was obtained for the coefficient  $\alpha$  in the linear approximation  $dW(T_0)/d\phi(T_0) = 1 + \alpha T_0/M_{K^0}$ , which is also in good agreement with the  $|\Delta I| = 1/2$  selection rule. Assuming the existence of a  $\sigma$ -dipion resonance, the following values are obtained for its mass and width:  $M_\sigma = (350 \pm 10) \text{ MeV}$  and  $\Gamma_\sigma = (75 \pm 15) \text{ MeV}$ . In conclusion, the authors consider it their pleasant duty to thank B. M. Pontecorvo [Pontecorvo] for fruitful discussions and constant interest in the work; V. I. Veksler, I. V. Chuvpilo and the entire staff of the proton-synchrotron, who assured the execution of the experiment; and E. L. Andronikashvili, V. P. Dzhelepov, and Z. Sh. Mandzhavidse for assistance in the work. Authors also extend their thanks to the group of laboratory technicians and mechanics consisting of N. I. Grafov, L. Goncharov, P. Zhabin, L. Lyubimov, D. Sverdlin, V. Smirnov, V. Stepanov, L. Filatov, and L. Filippov, and the students O. Dumbrayts and V. Novikov for performing the calculations. Orig. art. has: 10 figures, 4 tables, and 1 formula.

"The Provision of a Fetal Type of Blood Circulation and Gas Exchange in Human Fetuses Outside of the Maternal Organism."

Budapest, Orvosi Hetilap, Vol 107, No 43, 23 Oct 66, pages 2027-2028.

Abstract: [Authors' Hungarian summary] The possibilities of maintenance of a fetal type circulation outside of the maternal organism are discussed. The authors' own experiences are described in the course of which 6 human fetuses of 250-500 g weight, obtained from spontaneous abortions, were kept alive for 25-60 minutes by means of an oxygenator inserted between the umbilical artery and vein. The perfusion was arranged in such a manner that aspiration of the fluid by the fetuses could not take place in case of their eventual breathing. In this manner, the fetal type of circulation of an additional two fetuses was transformed to one of pulmonary type. 2 Hungarian, 9 Western references.

TITLE: The reaction of organocyclosiloxanes with butyl orthotitanate

PERIODICAL: Akta miya nauk SSSR. Izvestiya. Otdeleniye khimicheskikh nauk, no. 5, 1962, 833 - 837

TEXT: The reaction of butyl orthotitanate with octamethyl cyclotetrasiloxane, tetramethyl tetravinyl cyclotetrasiloxane, and octaethyl cyclotetrasiloxane were examined. In the reaction of octamethyl cyclotetrasiloxane with butyl orthotitanate (5:1, 3:1), only two molecules of the cycle react with one molecule of butyl orthotitanate to form the following

products: dimethyl dibutoxysilane ( $n_D^{20} = 1.4055$ ), 1,3-dibutoxytetramethyl disiloxane ( $d_4^{20} = 0.8700$ ;  $n_D^{20} = 1.4040$ ), 1,5-dibutoxyhexamethyl trisiloxane (b.p.  $96^\circ\text{C}/4$  mm Hg;  $n_D^{20} = 1.4031$ ;  $d_4^{20} = 0.8960$ ), 1,7-dibutoxyoctamethyl tetrasiloxane (b.p.  $118^\circ\text{C}/4$  mm Hg;  $n_D^{20} = 1.4049$ ;  $d_4^{20} = 0.9060$ ), and a

The reaction of organocyclosiloxanes ...

polymer of a chemically constant composition and the atomic ratio Si:Ti = 1:1. At 3:1 and 5:1 ratios of the initial components almost equal yields were obtained; however, at a 5:1 ratio, the part of non-reacting octamethyl cyclotetrasiloxane rose. At a 1:1 ratio, the yield of dimethyl dibutoxysilane, 1,3-dibutoxytetramethyl disiloxane, and of the polymer rose significantly. The polymers were readily soluble in benzene and toluene and had a vitrification temperature of  $\sim 100^{\circ}\text{C}$ . The formation of ethers and polymers is explained by disproportionation of the initial reaction products. Coordination of one of the oxygen atoms of organocyclosiloxane with the titanium atom of butyl orthotitanate takes place first:

The SiO bond in the cycle is thereby weakened, opens, and 1-butoxy-4-tri-butoxyoctaalkyl tetrasiloxane is formed:  
Card 2/4

S/062/62/000/005/004/006  
B110/B101

The reaction of organocyclosiloxanes ...

(B).

The latter is disproportioned to dialkyl dibutoxysilane, 1,3-dibutoxy-tetraalkyl disiloxane, and the polymer. The following succession holds for the reactivity of organosiloxanes with butyl orthotitanate:  $[(CH_3)_2SiO]_3 \gg [(CH_3)_2SiO]_4 > [CH_3(CH_2=CH)SiO]_4 > [(C_2H_5)_2SiO]_4$ . The large organic radicals are steric hindrances making the reaction difficult. Disiloxane ethers are easy to prepare in the manner described. There are 2 figures and 4 tables.

TITLE: Polymerization of methylphenylcyclsiloxanes

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 8, no. 7, 1966, 1252-1256

TOPIC TAGS: siloxane, organosilicon compound, polymerization catalyst, catalytic polymerization

ABSTRACT: In a study of the polymerization of organocyclsiloxanes in reactions of anionic polymerization, the polymerization of tetramethyltetraphenylcyclotetrasiloxane (I) and trimethyltriphenylcyclotrisiloxane (II) in the presence of various catalytic systems was investigated. Special catalysts having the formulas

where  $n = 8, 11, 15$ , were synthesized. In the presence of (A), the polymerization of

Card 1/2

UDC: 66.095.26+678.84

L 41226-66

ACC NR: AP6023432

(I) is slow and reaches equilibrium without any appreciable increase in the viscosity of the system. The polymerization of isomers of (II) is also slow. The cis isomer of (II) was found to be more active than the trans isomer and (I) in the polymerization reaction. This is attributed to the greater accessibility of siloxane bonds to attack by a nucleophilic reagent, whereas in the trans isomer all the Si-O bonds are screened by phenyl groups. Orig. art. has: 1 figure and 1 table.

TITLE: Preparative method for straight-chain high molecular weight organosilicon elastomers. Class 39, No. 190022 [announced by Institute of Heteroorganic Compounds, AN SSSR (Institut elementoorganicheskikh soedineniy AN SSSR)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 1, 1967, 74

TOPIC TAGS: elastomer, silicone, polysiloxane, heat resistant material, organo-silicon compound, organotitanium compound

ABSTRACT: An Author Certificate has been issued for a preparative method for straight-chain high-molecular-weight organosilicon elastomers. The method involves polymerization of alkylarylcyclosiloxanes in the presence of alkali hydroxide catalysts. To produce elastomers with enhanced heat resistance, the starting material used is a mixture of arylalkylcyclosiloxanes with tris[(trimethylsiloxy)polydimethylsiloxano](8-quinolinolato)titanium or with (dimethylsiloxano)bis(8-quinolinolato)titanium.
